

Research on the Modernization Construction of the Harmonious Coexistence between Humans and Nature in New Era

Zhang Yuanyu

Yulin University, Yulin, Shaanxi, China

Abstract: Since entering the new era, “beauty” has become one of the goals of China's modernization construction, highlighting the prominent position of ecological civilization construction in the entire modernization construction. This article attempts to systematically construct the writing logic structure of the modernization construction of harmonious coexistence between humans and nature through methods such as literature research, comparative argumentation, and comprehensive analysis. From different levels and perspectives, it proposes practical and feasible paths for building modernization of harmonious coexistence between humans and nature. The modernization of harmonious coexistence between humans and nature in the new era reflects the harmonious unity between humans and nature, the harmonious unity between material civilization and ecological civilization, and the harmonious unity between Chinese style and modernization. In view of this, we can focus on establishing the concept of green economic development, accelerating the green transformation of development methods, strengthening the legal norms of ecological environment, building the system of green financial to further expand the modernization of harmonious coexistence between humans and nature in the new era. This article provides important theoretical reference for the modernization construction of harmonious coexistence between humans and nature.

Keywords: Harmonious Coexistence between Man and Nature; New Era; Chinese-Style Modernization; Ecological Civilization

1. Introduction

Modernization is an inevitable trend for human

society to develop to a certain stage, but there are essential differences between Chinese-style modernization and western-style modernization. The construction of modernization in our country has many important, one of which is that modernization is a modernization of harmonious coexistence between humans and nature, emphasizing the synchronous promotion of material civilization construction and ecological civilization construction. It has important reference significance for countries around the world to solve modern ecological difficulties. Chinese path to modernization is a modernization that runs through the ecological principles and is committed to promoting the harmonious coexistence of human and nature. In order to build a sustainable development society and achieve the great rejuvenation of the Chinese nation, we must attach great importance to the construction of ecological civilization, and build a Chinese style ecological modernization of harmonious coexistence and mutual prosperity between humans and nature [1].

At present, there are several academic perspectives on the modernization of harmonious coexistence between humans and nature. Zhang Suqiang believes that the modernization of harmonious coexistence between humans and nature mainly includes two levels: it refers to the modernization of ecological reform in countries [2]. Again, from the perspective of reform level, it is a modernization of national rejuvenation, national prosperity and people's prosperity based on ecological prosperity, and a modernization that integrates development and protection. Scholars Ye Qi and Liu Kui also hold the same view on the definition of modernization with Chinese centered on the people [3]. Xie Pingzhen and Hu Shun believe that in the new era, harmonious coexistence between humans and nature is to solve ecological and environmental problems and meet the needs of the people for a better life.

Ye Qi and Wang Qing believe that the modernization construction of harmonious coexistence between humans and nature has extremely high historical value [4]. Firstly, it is conducive to alleviating the main contradictions in Chinese society; Secondly, it is conducive to achieving high-quality economic development in our country; Once again, it is conducive to enhancing China's voice and influence in global environmental governance; Finally, it helps to endow modernization with new connotations.

Although scholars have conducted in-depth research on the modernization of harmonious coexistence between humans and nature, and have achieved certain results, overall, further expansion is needed. Firstly, the research connotation needs to be further defined. The research in academia on the modernization connotation of harmonious coexistence between humans and nature focuses on the analysis of theoretical connotations, lacking understanding and grasp of its core essence, especially in the relationship between humans and nature and modernization; The second is that the research content needs further improvement [5]. The modernization theory of harmonious coexistence between humans and nature is a constantly enriching and developing process, and its specific practice is also a constantly improving process. Therefore, the comprehensiveness covered by its content also has certain shortcomings. This article adheres to the research method of combining theory and practice, and systematically, comprehensively, and comprehensively analyzes and explores the issues of modernization construction of harmonious coexistence between humans and nature, enhancing the scientific and practical effectiveness of research results. Through the analysis of the academic discourse on the modernization of harmonious coexistence between humans and nature, relevant theories, main contents, and construction paths are summarized, in order to propose one's own views on the modernization of harmonious coexistence between humans and nature, and propose corresponding construction paths, making the research content more complete and reflecting the systematic nature of the article.

2. Modernization Connotation of the

Harmonious Coexistence between Humans and Nature in New Era

2.1 Harmonious Unity between Humans and Nature

The harmonious unity between humans and nature is a concept that has always been upheld in modernization and ecological civilization construction, and has important guiding significance for the modernization construction of harmonious coexistence between humans and nature. However, with the rapid development of the social economy, while promoting the progress and prosperity of human civilization, it has also brought tremendous damage and impact to nature. In the development laws of the natural world, humans are born out of nature, and nature develops and changes through human practical activities. There is a symbiotic relationship between humans and nature. Although humans can actively utilize and transform nature through their own conscious activities, they can only act according to the laws of nature [6]. Therefore, humans must respect the laws of nature, otherwise they will suffer from the retaliation of nature. The modernization construction of harmonious coexistence between humans and nature is based on a correct understanding of the relationship between humans and nature, and the construction of modernization. It is an ecological modernization that treats nature with a good attitude, respects nature, conforms to nature, protects nature, and properly handles economic development and ecological environment protection. The concept of "harmonious unity between humans and nature" vividly expresses the relationship between humans and nature. Only by adhering to this concept can we truly achieve modernization, that is, ecological modernization.

2.2 Harmonious Unity between Material Civilization and Ecological Civilization

In the modernization construction of harmonious coexistence between humans and nature, it is crucial to promote the construction of material civilization and ecological civilization. We must accelerate the construction of a sound green, low-carbon, and circular development economic system, in order to achieve the unity of material

civilization and ecological civilization [7]. In recent years, with the proposal of the modernization construction of harmonious coexistence between humans and nature, the country has made efforts to promote the comprehensive green transformation of social development from multiple aspects and perspectives, accelerate the adjustment of industry and energy structure, focus on pollution reduction and carbon reduction, increase ecological environment protection efforts, strictly abide by the ecological environment protection red line, and comprehensively improve the utilization efficiency of resources and environment through scientific planning and control [8]. We need to achieve economic development on the basis of protecting the ecology, while also protecting the ecology, in order to achieve the unity of material civilization and ecological civilization, and better achieve modernization construction. The unity of economic and ecological benefits is the key to solving the problem of high-quality development in the new era and promoting the modernization of harmonious coexistence between humans and nature. The harmonious unity of material civilization and ecological civilization is the main goal of the current modernization construction of harmonious coexistence between humans and nature. With the joint promotion of economic development and ecological protection, modernization is being built to promote the construction and development of a beautiful China.

2.3 Harmonious Unity between Chinese Style and Modernization

Chinese-style modernization is a modernization rooted in China, and it is a modernization with unique that is significantly different from western capitalism. It is a new modern, absorbing advanced scientific, technological, and management experiences from various countries around the world, and achieving achievements through reform and innovation in combination with the actual situation of the country. China has always adhered to the goal and direction of struggle. Therefore, Chinese-style modernization has many important, overcoming the inherent drawbacks of capitalism and providing a new path for the modernization of human

society. It marks the continuous improvement of Chinese system and a significant step forward in the great rejuvenation of the Chinese nation. This is an unprecedented profound transformation and historic leap in human history. China has a vast territory, a large population, and significant regional differences. How to achieve modernization in such a country is a global concern. Chinese-style modernization means that the number of people entering the modernization ranks will exceed the sum of all developed countries, with a global impact.

3. Paths of Modernization Construction of the Harmonious Coexistence between Humans and Nature in New Era

3.1 Establish the Concept of Green Economic

A correct development concept is essential for building a modern harmonious coexistence between humans and nature. The ultimate realization of harmonious coexistence between humans and nature depends on the ability of various social entities to form a joint governance force. From the perspective of the government, for a long time, influenced by the logic of Western capital, economic growth has been equated with social progress [9]. It has led to the phenomenon of local governments blindly developing natural resources, pursuing economic growth, and neglecting ecological protection. Ecological and environmental problems have occurred frequently in various regions, which goes against our original intention of modernization. We should establish a green evaluation system, firmly implement the development concept of putting the people at the center, and strive to achieve high-quality and sustainable economic development as well as the people's demand for a beautiful ecological environment, and implement the concept of green development locally. For society, ecological concepts should be integrated into all aspects and processes of social development, and efforts should be made to promote ecological civilization. A social atmosphere of resource conservation and environmental protection should be created, and ecological and environmental awareness should be implemented in the hearts of every citizen. We should vigorously advocate for the

whole society to consciously assume the main responsibility of protecting the environment, choose green production and life models, and deeply embed the concept of green development in people's hearts. Each enterprise should consciously implement the concept of green development throughout, strengthen the environmental awareness and effectiveness assessment of various departments, focus on the long-term, and leave a green cradle for sustainable development for society. For citizens, we should inherit and carry forward the traditional virtues of diligence, thrift, and thrift of the Chinese, and contribute to the modernization of harmonious coexistence between humans and nature.

3.2 Accelerate the Transformation of Development Model

Faced with the multifaceted challenges of transformation, China needs to actively build a system of green production, consumption, circulation, and distribution. As the primary driving force for green transformation, the government should increase subsidies for green funds for enterprises, improve the level of green taxation, encourage enterprises to voluntarily strengthen the construction of innovative talent teams, actively research and develop innovative green technologies, and ensure the stability of green transformation. Each enterprise should effectively implement the concept of green development, regard the green transformation of production methods as a long-term task, eliminate high-energy consumption and low efficiency industrial chains, increase the proportion of green products, reasonably develop natural resources, and consciously resource and harmless production process waste and harmful substances [10]. Green transformation is a profound transformation that requires the joint efforts of all sectors of society to contribute to the construction of a beautiful China. The green economy development model is a new type of development model pursued by the modernization construction of harmonious coexistence between humans and nature, involving various aspects. It not only requires the closure of high consumption industries in various regions, but also the

upgrading and transformation of local industries, and the introduction of a number of emerging industries. We should promote the transformation and upgrading of economic industries, achieve the goal of ecological priority and green development, and create a green and ecological economy with local. We need to accelerate the cultivation of new forms of ecological industries, promote the integration of industries and extend the ecological product industry chain, promote the development of new ecological industries, and further promote structural optimization and upgrading, rational allocation of resources, and improve the comprehensive benefits of ecological industries. At the same time, China should increase investment in scientific and technological innovation and strictly control the utilization of resources from the source and process.

3.3 Strengthen the Law of Ecological Environment

To build a modern harmonious coexistence between humans and nature, it is necessary to accelerate the formulation and revision of laws and regulations that are compatible with the construction of ecological civilization, and ensure the early realization of the harmonious coexistence between humans and nature through the force of the state. In recent years, the legalization level of ecological civilization construction in China has gradually improved, laws and regulations have been gradually introduced, and a basic ecological civilization legal system has been established. The legal environment for ecological civilization construction has significantly improved. However, there is still a gap between the goal of establishing the strictest rule of law to protect the ecological environment, and the construction of ecological rule of law still faces problems such as fragmentation, high repetition rate, and lax law enforcement. The legislative branch should further adjust and improve some blank and relatively lagging laws and regulations in accordance with the new situation and requirements. We need to establish a systematic thinking approach, closely monitor institutional reform and practical innovation in the field of ecological environment, learn effective experiences and practices, unify ecological environment related

laws and regulations into comprehensive regulations, and strengthen the construction of relevant laws and regulations. We should establish and improve the strictest and most rigorous legal system for ecological environment protection, and continuously improve the legal system for ecological civilization.

3.4 Build the System of Green Financial

Finance is the lifeblood of the real economy and an important core competitiveness of a country. Compared to traditional finance, green finance places more emphasis on the environmental benefits of human survival. Financial institutions promote various market entities to actively consider the ecological efficiency generated by economic activities through fund allocation and policy guidance, thereby changing the way of life and production, and achieving sustainable economic and environmental development. Currently, China has become one of the world's largest green finance markets, especially with the proposal of the "dual carbon" goal accelerating the development of the domestic green finance system. Financial institutions led by commercial banks gradually shift their funds from high polluting and energy consuming industries to environmental and energy-saving sectors through green credit tools. Enterprises with green projects actively issue green bonds to guide more social funds to participate in green industry investment. Building a green financial system that promotes Chinese path to modernization can promote long-term and stable economic growth through risk diversification and cost sharing functions, and can also give good consideration to environmental benefits. To provide diverse and efficient financing support for the construction of ecological civilization, it is necessary to continuously improve the construction of China's green finance system through multi-party collaboration. To this end, financial institutions should be encouraged to innovate green financial products, expand investment and financing scale and term, and meet the funding needs of green projects in the market; Strengthen the supporting role of financial technology in the construction of green financial

infrastructure; Unify green financial standards, establish and improve environmental information disclosure system, provide comprehensive and reasonable evaluation basis for domestic and foreign investors, and promote the realization of Chinese path to modernization of harmonious coexistence between man and nature.

4. Summarize

The modernization construction of harmonious coexistence between humans and nature is a lasting and innovative process. We must establish the concept of green economic development, accelerate the green transformation of development methods, provide legal protection for harmonious coexistence between humans and nature and build the system of green financial to provide development momentum for the modernization of harmonious coexistence between humans and nature for the construction of a modernized strong country.
